

IN THE CLAIMS:

Please cancel Claims 36, 44, 46 and 47 without prejudice or disclaimer of subject matter, and amend Claims 29 to 35, 37 to 43 and 45 as shown below. The claims, as pending in the subject application, read as follows:

1. to 28. (Canceled)

29. (Currently amended) A printing system which enables a printing device to print data transmitted by a remote computer, said system comprising:

a store controller unit that causes a memory unit to store print data of a first type job transmitted by said remote computer, ~~wherein said first type job is not a second type job to which a first request by using user interface provided by said remote computer is not performed;~~

a user interface controller unit that causes a user interface unit of said printing device to perform display for selecting at least one of a plurality of data including the print data which has been stored in said memory unit; and

an operation controller unit that causes said printing device to perform a first printing operation, ~~relating to~~ a second printing operation and a third printing,

wherein the first printing operation and the third printing operation are operations ~~is an operation~~ for printing scan image data obtained by using a scanner unit ~~to a sheet needed as a cover sheet~~,

wherein the second printing operation is an operation for printing the print

data stored in the memory unit and selected via said user interface unit by using,

wherein the print data of the first type job is stored in the memory unit without starting a printing by said printing device in accordance with receiving the first request via said user interface provided by said remote computer,

wherein a printing result of the scan image data is attached to printing results of the print data as a bundle of printing results,

wherein the bundle of printing results is obtained by performing the first printing operation, [[and]] the second printing operation and the third printing operation are sequentially performed in order of the first printing operation, the second printing operation and the third printing operation, in response to inputting a single user instruction as a second request via said user interface unit of said printing device, [[and]]

wherein the print data to be printed in the second printing operation is obtained before inputting the single user instruction and [[the]] first scan image data to be printed in the first printing operation and the second scan image data to be printed in the third printing operation are obtained by using the scanner unit is obtained after inputting the single user instruction, and

wherein a sheet subjected to printing by the second printing operation is disposed between the cover sheet subjected to printing by the first printing operation and the cover sheet subjected to printing by the third printing operation.

30. (Currently amended) A printing system according to Claim 29,
wherein, ~~in the case where the job output from said remote computer is said first type job~~

corresponding to the job that the first request was performed in said remote computer, said store controller unit causes said memory unit to store the print data of said first type job in a state of raster image data without starting of the printing by said printing device.

31. (Currently amended) A printing system according to Claim 29, wherein said user interface controller unit ~~causes said user interface unit of said printing device to display as said display~~ a list screen formed to be able to discriminate document names of the print data ~~said plurality of jobs~~.

32. (Currently amended) A printing system according to Claim 29, wherein, the cover sheet of ~~in the case where said first type job is selected from said plurality of jobs via the display and in a case where a third request is performed via said user interface unit of said printing device, said operation controller unit causes said printing device to execute a third operation that performs printing of scan image data of two pages obtained by using the scanner unit to two sheets needed as a front cover is subjected to printing by the first printing operation and the cover sheet of~~ [[and]] a back cover sheet is subjected to printing by the third printing of a print of said first type job without performing said first operation, and causes said printing device to execute said ~~second~~ operation.

33. (Currently amended) A printing system according to Claim 29, wherein, ~~in the case where said first type job is selected from said plurality of jobs via the~~

display and in a case where a fourth request is performed via said user interface unit of said printing device, said operation controller unit further causes said printing device to perform execute a fourth printing operation to print that performs printing of scan image data of three pages obtained by a using the scanner unit as an overlay original while the to a plurality of insert sheets to be inserted to a print of said first type job without performing said first operation, and causes said printing device to execute said second printing operation is being performed.

34. (Currently amended) A printing system according to Claim 29, wherein the cover sheet consisting of a front cover and a front cover reverse is subjected to printing by the, in the case where said first type job is selected from said plurality of jobs via the display and in a case where a fifth request is performed via said user interface unit of said printing device, said operation controller unit causes said printing device to execute a fifth operation that performs printing of scan image data of four pages obtained by using the scanner unit to a plurality of insert sheets to be inserted to a print of said first type job without performing said first printing operation[[.]] and the cover sheet consisting of a back cover and a back cover reverse is subjected to printing by the third printing causes said printing device to execute said second operation.

35. (Currently amended) A printing system according to Claim 29, wherein, in a case where a specific instruction is input via said user interface unit ~~of said printing device before said second request~~, said operation controller unit causes to delete

the print data which is printed by said printing operation of said first type job from said memory unit after completion of said second printing operation.

36. (Canceled)

37. (Currently amended) A controlling method of a printing system which enables a printing device to print data transmitted by a remote computer, the method comprising:

causing a memory unit to store print data ~~of a first type job~~ transmitted by said remote computer, ~~wherein said first type job is not a second type job to which a first request by using a user interface provided by said remote computer is not performed;~~

causing a user interface unit of said printing device to perform display for selecting at least one of a plurality of data including the print data which has been stored in said memory unit; and

causing said printing device to perform a first printing operation, ~~relating to a printing second operation and a third printing, wherein the first operation is an operation for printing the print data selected by using the display,~~

wherein the first printing operation and the third printing operation are operations for printing scan image data obtained by a scanner unit as a cover sheet,

wherein the second printing operation is an operation for printing the print data stored in the memory unit and selected via said user interface unit,

wherein the print data of the first type job is stored in the memory unit

without starting a printing by said printing device in accordance with receiving the first request via said user interface provided by said remote computer;

wherein a printing result of the scan image data is attached to printing results of the print data as a bundle of printing results;

wherein the bundle of printing results is obtained by performing the first printing operation, ~~[[and]] the second printing operation and the third printing operation~~ are sequentially performed in order of the first printing operation, the second printing operation and the third printing operation, in response to ~~inputting~~ a single user instruction ~~inputted~~ as a second request via said user interface unit of said printing device, ~~[[and]]~~

wherein the print data to be printed in the second printing operation is obtained before inputting the single user instruction and ~~first~~ ~~[[the]]~~ scan image data to be printed in the first printing operation and second scan image data to be printed in the third printing operation are ~~[[is]]~~ obtained by using the scanner unit after inputting the single user instruction, and

wherein a sheet subjected to printing by the second printing operation is disposed between the cover sheet subjected to printing by the first printing operation and the cover sheet subjected to printing by the third printing operation.

38. (Currently amended) A controlling method according to Claim 37, wherein, ~~in the case where the job output from said remote computer is said first type job corresponding to the job that the first request was performed in said remote computer,~~

said controlling method causes said memory unit to store the print data of said first type job in a state of raster image data ~~without starting of the printing by said printing device.~~

39. (Currently amended) A controlling method according to Claim 37, wherein said controlling method causes said user interface unit ~~of said printing device to display as said display~~ a list screen formed to be able to discriminate document names of the print data said plurality of jobs.

40. (Currently amended) A controlling method according to Claim 37, wherein the cover sheet of, in the case where said first type job is selected from said plurality of jobs via the display and in a case where a third request is performed via said user interface unit of said printing device, said controlling method causes said printing device to execute a third operation that performs printing of scan image data of two pages obtained by using the scanner unit to two sheets needed as a front cover is subjected to printing by the sheet and a back cover sheet of a print of said first type job without performing said first printing operation[.]] and the cover sheet of a back cover is subjected to causes said printing by the third printing device to execute said second operation.

41. (Currently amended) A controlling method according to Claim 37, further causing said printing device to perform wherein, in the case where said first type job is selected from said plurality of jobs via the display and in a case where a fourth

request is performed via said user interface unit of said printing device, said controlling method causes said printing device to execute a fourth printing operation to print that performs printing of scan image data of three pages obtained by a using the scanner unit as an overlay original while the to a plurality of insert sheets to be inserted to a print of said first type job without performing said first operation, and causes said printing device to execute said second printing operation is being performed.

42. (Currently amended) A controlling method according to Claim 37, wherein the cover sheet consisting of a front cover and a front cover reverse is subjected to printing by the first printing operation and the cover sheet consisting of a back cover and a back cover reverse is subjected to printing by the third printing operation; in the ease where said first type job is selected from said plurality of jobs via the display and in a case where a fifth request is performed via said user interface unit of said printing device, said controlling method causes said printing device to execute a fifth operation that performs printing of scan image data of four pages obtained by using the scanner unit to a plurality of insert sheets to be inserted to a print of said first type job without performing said first operation, and causes said printing device to execute said second operation.

43. (Currently amended) A controlling method according to Claim 37, wherein, in a case where a specific instruction is input via said user interface unit ~~of said printing device before said second request~~, said controlling method causes to delete the

print data which is printed by ~~[[of]]~~ said second printing operation ~~first type job~~ from said memory unit after completion of said second operation.

44. (Canceled)

45. (Currently amended) A computer-readable storage medium storing a computer-executable program for executing a controlling method of a printing system which enables a printing device to print data transmitted by a remote computer, by a printing device, said method comprising:

causing a memory unit to store print data ~~of a first type job~~ transmitted by said remote computer, ~~wherein said first type job is not a second type job to which a first request by using a user interface provided by said remote computer is not performed;~~

causing a user interface unit of said printing device to perform display for selecting at least one of a plurality of data including the print data which has been stored in said memory unit; and

causing said printing device to perform a first printing operation, ~~relating to a second~~ printing operation ~~and a third printing operation~~.

wherein the first printing operation ~~and the third printing operation are operations~~ ~~is an operation~~ for printing scan image data obtained by using a scanner unit ~~to a sheet needed as a cover sheet~~.

wherein the second operation is an operation for printing the print data stored in the memory unit and ~~selected via said user interface unit by using the display~~.

wherein the print data of the first type job is stored in the memory unit without starting a printing by said printing device in accordance with receiving the first request via said user interface provided by said remote computer;

wherein a printing result of the scan image data is attached to printing results of the print data as a bundle of printing results;

wherein the first printing operation, bundle of printing results is obtained by performing the first operation and the second printing operation and the third printing operation are sequentially performed in order of the first printing operation, the second printing operation and the third printing operation, in response to ~~inputting~~ a single user instruction inputted as a second request via said user interface unit of said printing device, [[and]]

wherein the print data to be printed in the second printing operation is obtained before inputting the single user instruction and first [[the]] scan image data to be printed in the first printing operation and second scan image data to be printed in the third printing operation are [[is]] obtained by using the scanner unit after inputting the single user instruction, and

wherein a sheet subjected to printing by the second printing operation is disposed between the cover sheet subjected to printing by the first printing operation and the cover sheet subjected to printing by the third printing operation.

46. and 47. (Canceled)
